

We have designed a project which is focused on the formulation of a new bio pesticide product on a commercialized level.

The project has a novelty in itself in such a way that origin of compounds that'll be used as active ingredients will be derived from specific rhizosphere regions which are present only in Pakistan and this finding was made only a decade ago but unfortunately limited studies were conducted.

We have already identified and analyzed the potential compounds and field experiments were conducted on a small scale but the results were astonishing.

What we have is a pure product a.k.a Trade insecticide ( no inert material) which after formulation will be officially labeled as a pesticide

This is just a brief outline of this project and to execute this project, we require support from commercial industries that can support us as much as they can include finance, on-ground trainings, field trials and especially the type of formulation.

There are various reasons as why this project is a dire need of our country but the most important is part is to patent the product
